Multiplication

Multiplication

Java uses the `*` operator for multiplication.

```
int a = 5;
int b = 10;
System.out.println(a * b);
```

TRY IT

```
50
```

What happens if you:
- Change `b` to `0.1` ?
- Change `b` to `-3` ?

TRY IT

```
-15
```

▼ Hint
`*=` works similar to `+=` and `-=`

Multiplication

Complete the code below so that the program prints the product of `a` and `b`.

```
int a = 5;
int b = 9;
System.out.println( a * b);
```

Use `*` for multiplication. You also need to add the variable b, multiplication requires two numbers.

```
System.out.println(a * b);
```
